PART 1 · THE FRAMEWORK

My Strategy Framework

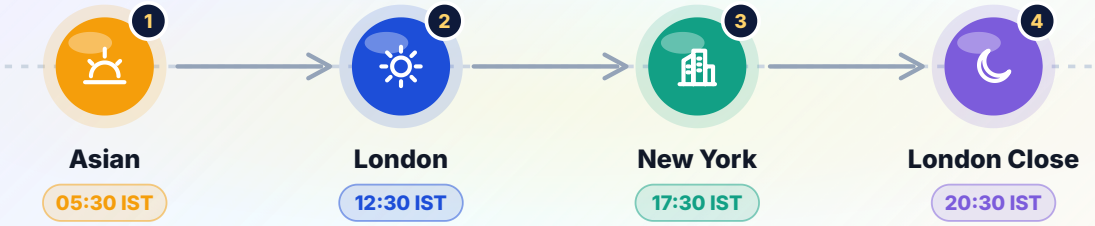

Eight steps, in order, before every trade.

The Step-by-Step Flow

Entry Timing: Sessions Only

Enter **only** inside these sessions. No session, no trade. (Winter, Nov–Mar: London & New York +1 hr)

Narrative: Where, Why, When

No clear **Where**, **Why** and **When**? No trade.

Where Not to Trade

Stay out. **Wait** for clean price after the event.

Key Levels & Zones

KEY LEVEL ZONES · TIME FRAMES

1H → 4H → Daily → Weekly → Monthly

Order Blocks
- Strong OB
- Weak OB
- Fake OB
- Advance OB

Other Blocks
- Mitigation Block
- Rejection Block
- Breaker Block
- ROB Refine OB
- Double PD Array

Imbalances
- FVG Fair Value Gap
- IFVG Inversion FVG
- Volume Imbalance
- Liquidity Void
- Gap Imbalance
- BPR Balanced Price Range
- Breakaway Gap

Highs & Lows
- PDH / PDL Prev. Day
- PWH / PWL Prev. Week
- PMH / PML Prev. Month
- All-Time H / L
- Swing H / L
- OHLC / OLHC Candle Profile

Liquidity
- Liquidity Sweep
- Liquidity Grab
- Equal Highs / Lows
- Liquidity Pool
- Liquidity Run
- Liquidity Delivery

Key POI Zones
- OTE Optimal Trade Entry
- Last POI
- FCZ Fractal Compression Zone
- HIPPO
- ILDRE Inst. Liq. Delivery & Repricing
- Fair Value Area

Range Liquidity
- IRL Internal Range Liquidity
- ERL External Range Liquidity
- LRLR Low Resistance Liq. Run
- HRLR High Resistance Liq. Run
- P / D Premium & Discount Zone

Structure Shifts
- MSS Market Structure Shift
- CISD Change in State of Delivery
- Displacement FVG
- Impulse Swing Protection

Price Cycle
- PO3 Power of Three
- AMD Accum · Manip · Distrib
- Judas Swing
- Displacement → Pullback → Expansion → Magnet Point
- Market Profiles

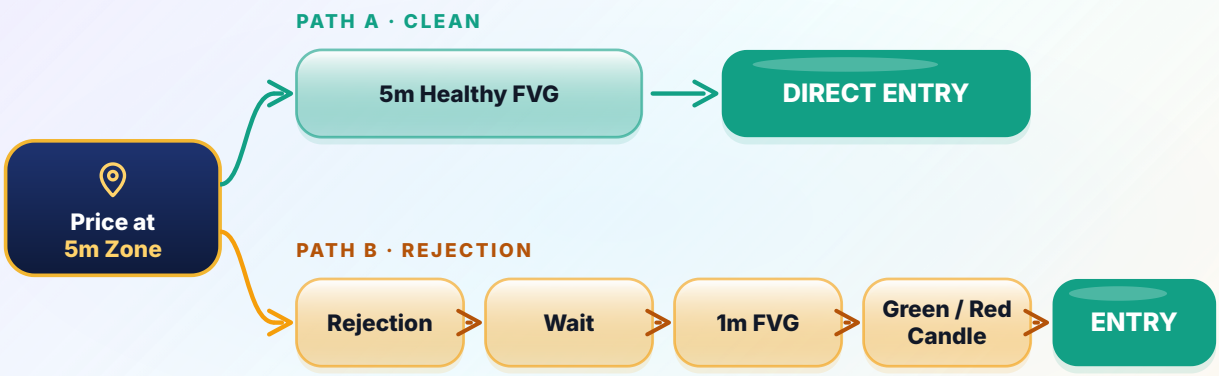

Mark these levels first. Trade **only** from a key level.

Time Frame Alignment for Entry

ZONE	ENTRY	
Monthly	4H	Daily
Weekly	4H	1H
Daily	1H	30m
4H	15m	5m

ZONE	ENTRY	
1H	15m	5m
15m	5m	3m
5m	3m	1m
1m	Green / Red candle + Healthy FVG	

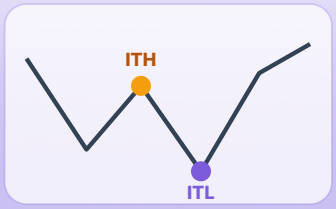

Entry Confirmation

Candle must close in your direction before entry

Extra Confirmation

Zone Not Confirmed?

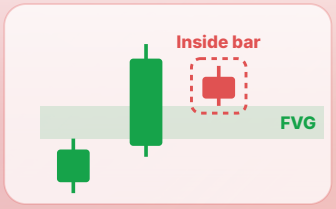

Wait for the
ITL / ITH to form

HTF = LTF View

Higher & lower time frame
must show the same view

5m FVG + Inside Bar

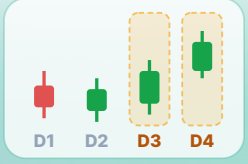

3rd candle inside the 2nd?
Wait for 1m confirmation
4th rejects 3rd → direct entry

Not sure? **Wait.** A missed trade costs nothing.

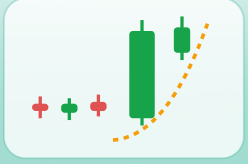

Direct Entry on 5m FVG: When?

1

3rd / 4th Candle
of Daily TF

2

Displacement /
Expansion / Reversal

3

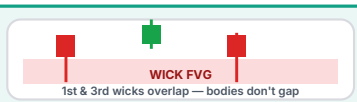

After High-Impact
News

4

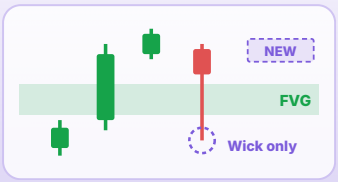

Key Level of
Daily / Weekly / Monthly

Wick FVG is also valid for direct entry — needs **healthy rejection** on the 3rd candle.
Wick FVG: 1st & 3rd candle wicks overlap without actual FVG

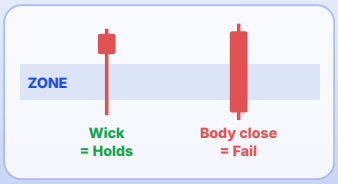

FVG & Zone Rules

Wick Through OB?

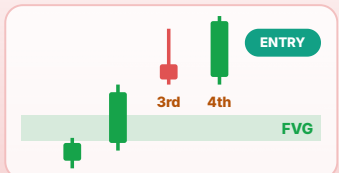

OB upper body didn't close? Zone still valid — wait for **new 5m FVG at the same zone**

When a Zone Fails

Zone fails only when a same-TF **candle body closes beyond it**

Rejection Cancelled

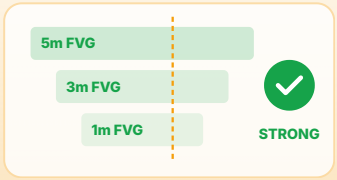

3rd rejected, 4th erased it? **Direct entry still valid**

Same Rules, Every TF

1m FVG? Same process, then **green / red confirmation**

5m + 3m + 1m FVG

FVG on all 3 at the same spot? **Stronger setup (any TF)**

No Strong 5m FVG?

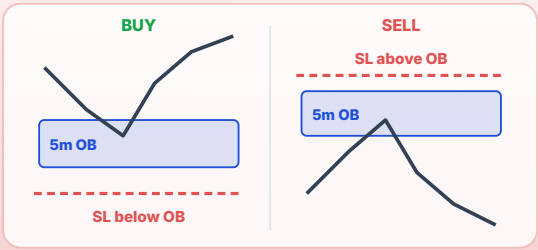

Usually building liquidity **Hunt first, then the move**

Wick is not a break. **Body close** decides.

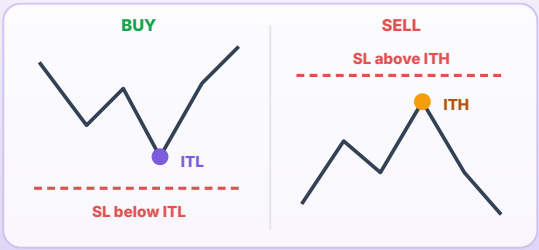

Where to Place Stop-Loss

Order Block Stop-Loss

Place SL beyond the 5m Order Block **Below for buy · Above for sell**

ITH / ITL Stop-Loss

Trade taken from the ITH / ITL? **Place SL beyond that ITH / ITL**

Buy: SL **below**. Sell: SL **above**.

Target

Minimum **1:2 RR**. At **1:1.5**, move stop-loss to cost (CTC).

Target Levels

Liquidity Targets

- Swing Liquidity
- LRL
- Internal Range Liquidity

15m 30m 1H 4H

Block Targets

- **MB** Mitigation Block
- **BB** Breaker Block
- Weak OB
- Fake OB

Imbalance Targets

- Gap Imbalance
- Volume Imbalance

Take profit at the **nearest** opposing level.

Stages of an Ideal Trade

Mistakes to Avoid: Checklist

Journal Daily
Record every trade. Review every week.

NO JOURNAL
NO GROWTH

PART 2 · MISTAKES

Trading Mistakes

Mistakes

1. Follow the indicator in the direction of the bias.
2. After 1:1.5 RR, move SL to cost-to-cost (breakeven). If the breakeven SL is hit, you can plan again if the bias still gives LTF confirmation.
3. In trading, not a single mistake is forgiven — the market punishes.
4. Safe TP and SL are very important
5. Don't trust the black gold indicator — take extra confirmation from it like a confirmation. Follow the indicator with the bias only
6. Follow timing: trade in sessions only.
7. CTC (breakeven) is the best option — at least you won't take a loss. If in doubt, move to CTC. If price reaches 1:1 RR, move to CTC. If CTC is hit after that, you can plan again if the setup forms again.
8. Don't trade with ego or anger.
9. Trade only after the pattern has fully formed — e.g. if a 5m FVG is about to form, don't enter after only two candles.
10. Don't trade with a hoping mindset.
11. Don't plan a trade that can end in a big loss.

Mistakes (continued)

12. No trading in the office.
13. No gambling.
14. No loss recovery — trade only your setup and follow the process.
15. No hopping trading — don't jump from pair to pair or from setup to setup.
16. Don't increase your lot size after continuous SLs.
17. Don't take multiple trades at once in the same direction — wait until the first trade is at CTC.

PART 3 · TRADE MANAGEMENT

Trade Management

Trade Management

1. If you are taking 1m FVG confirmation, enter only after the FVG forms and the green/red candle closes.
2. Keep a safe target — don't be greedy. E.g. if MB/BB and OB are done, take TP at the MB and exit; the same for OB and FVG — take TP at the FVG and exit.
3. If there is a gap up / gap down, TP is the gap (fill), or below/above the swing.
4. At a 5m POI (5m zone), look for a 1m FVG — there should be 1–2 FVGs.
5. At a 15m zone, look for a 5m FVG.
6. At a 4H POI, look for a 15m (or at most 30m) FVG
7. For targets, use MB/BB or swings as the safe target. If there is an MB/BB, keep it as the safe target
8. At 4H/daily POIs, look for a 15m FVG. At a 1H zone, look for a 5m FVG. At a 15m zone, look for a 5m/3m FVG.
9. POI timeframe → confirmation timeframe:
   15m → 5m · 5m → 1m/3m · 3m → 1m · 1m → green/red candle + healthy candle (buy)-"Sell": 1H → 15m/5m · 4H → 15m · Daily → 30m/1h
10. At an all-time high, the target can be the nearest round number Or you can apply a swing projection.
11. Monthly and weekly → 1H confirmation.

Trade Management (continued)

12. You can refine down to the 5m. If a 1m FVG forms at the 30m zone, enter after one green 1m candle for buys (vice versa for sells), then trail the SL.
13. If the first POI feels risky, plan the trade at the second POI after it forms, on the 1m.
14. If in doubt, take double confirmation from the 1m POI.
15. If the POI is right, you can enter after a 5m FVG forms — whether or not the 5m POI is tapped (retested). Note: OB + FVG = POI.
16. You can take TP at the overlapping part
17. You can trail the SL from OB to OB
18. Suppose a candle's wick is forming and another candle closes its body there — that gives confirmation in the price's favour.
19. If you miss the entry, then when an FVG forms on the 5m at the 30m, enter after it forms, and keep the SL below/above the 30m. Don't wait for the retest.
20. If you enter from the ITH/ITL, keep the SL at the ITL/ITH as well.
21. Also keep the TP at the overlapping part, and at a HIPPO.
22. Keep the SL in the proper place — decide it in advance.
23. Keep the SL small. And take big target
24. Pairs I trade: XAUUSD, EURUSD and BTC only.

PART 4 · KEY REMINDERS

Points to Always Remember

Points to Always Remember

1. NFP news is very powerful.
2. Structure → TF → liquidity are fractal → POI also.
3. The market spends 70% of its time in accumulation → waiting time.
4. In expansion and displacement, move will be very smooth and in th the pullback very small — it keeps going up/down
5. Don't assume a pattern in the market — after it forms, confirm it like then assume fvg will form in two candles itself let them to form completely.
6. Keep in mind inflation / news and the report / data.
7. When there is no news, the Asian session gives a good move.
8. And where a 15m POI's retest does not happen, a big rally happens there
9. In 3 candles, the 4th candle is expansion.
10. When news gives both +ve and –ve, price stays in a range — but NFP news is powerful. A single candle also forms.
11. In the market, if there is no news, the market moves according to structure and liquidity.
12. If structure is not clear in the market, wait for structure to form

Points to Always Remember (continued)

13. Mark premium and discount zones for major swings.
14. Many times, when there are no orders in market then liquidity gets created and then hunted.
15. PDL/PDH work in a ranging market.
16. MB/BB are very powerful when price can't do the last POI
17. When Monday comes, see what happened last week. If needed, look at the last 2 weeks too, and also look at the news in Forex Factory.
18. When price stays bullish for 2–3 months, in the third or fourth month it comes down to do (mitigate) the last POI.
19. Before news, the market goes quiet and tries to trap.
20. When a candle opens, mark the opening part of the daily candle.
21. OB + FVG are one-time use only → only unmitigated OF will work.
22. Mark the daily candle's open, high and low
23. Every time in gold, after a bull run, price goes into a range
24. If there are POIs on both sides, then give priority to the overall bias.
25. Retracement is the waiting phase.
26. Check the news before opening the chart and Analyse the news of the past one week

Points to Always Remember (continued)

27. Do fundamental analysis.
28. Understand what is happening now and what is going to happen next.
29. Look at both the overall view and the current view
30. The HTF and LTF views should be the same
31. Read the chart and the situation
32. Whenever you take a trade, you should be sure about it.

PART 5 · TECHNICAL

Technical Rules

Technical

1. Mostly, a 15m POI does not break until price reaches a key level. If there is a POI above it on a higher TF, price can go up to that level; otherwise it mostly does not break.
2. In a 3-candle swing, watch the 4th candle
3. When price is ranging, the PDL and PDH work (as key levels) on the daily.
4. If the POI is internal, the target liquidity should also be internal — IRL.
5. When price reaches an HTF POI, it will form a range there.
6. If there is news in the evening, there will be AMD and trapping all day. After the news, price sweeps and then moves in one direction with displacement.
7. At the start of the week, price can trap until Monday evening, or trap for 1–2 days, and then make the actual move.
8. When there is no news, the move comes in the Asian and London sessions, and then price traps in New York.
9. When there is no news, price moves according to structure and liquidity.
10. At the monthly open, price can trap for 2–3 days, or even the whole week
11. The overall move comes only after the last POI or last liquidity is taken — or price goes to an all-time high.

Technical (continued)

12. MB/BB can also be targets.
13. Also check the 15m MB/BB when there is a 15m OB + FVG and price is not coming to the 30m.
14. If you are waiting for a retest at a 15m POI and there is an opposing POI, there is a very high chance the retest will happen.
15. In a running trade, watch whether price will first retest and then go to the POI, or go to the last POI on the LTF. E.g. if price is going to the 1H level before the target, enter on the retest.
16. Direction (bias): how far price will go comes from the HTF; where it will go from comes from the LTF. Take entry confirmation with an FVG, and in the direction of the bias check whether there is LRL or not.
17. If SL is hit, you can plan the trade again — but only if the zone still has power. But wait for 5m FVG too
18. In gold, MB/BB mostly work on the HTF: 4H, 1H, daily, weekly, monthly.
19. If there are FVGs on both sides (say on the 15m TF), wait for one side's FVG to break. If the FVG against the bias breaks, it becomes a very good setup. This mostly happens when price is in a range.
20. Especially in USDJPY, price taps the FVG and leaves, so mark both.
21. Trade with the main bias. Use LRL, narrative and session for the trade, and FVG for confirmation. The zone should be on the 1H / 4H / daily / weekly / monthly.
22. At an all-time high you cannot confirm how far price will go — a reversal can come from anywhere. So wait for three candle swing for reversal

Technical (continued)

23 If gold reverses, DXY should show buying on the daily TF — only then is it a real reversal. This confirmation is especially good when price is at an all-time high.

24 Say you are waiting for price to reach a zone. At that zone, a three-candle swing with an FVG should also form — then enter.

25 If an FVG forms in favour of your direction, it acts as a defence point from which price pushes. If there is an opposing POI against it, your-direction POI can push price back in your direction again and The FVG also gives confirmation.

26 At the HTF's last POI, price usually does not retest; it mostly forms an FVG there and then moves on.

27 If price makes two or three FVGs and does not come back to the last FVG, but there is swing liquidity hunt then you can enter from there.

28 USD news also has an impact on BTCUSD.

29 Suppose price falls from an FVG and has already hit the target — then the OB below will not work. But if price only tapped the FVG and the target is not done, it can fall from the OB.

30 A zone becomes invalid only when a candle body of the same TF as the zone closes beyond it

31 If an inside-bar candle supports the bias, you can still consider it.

32 At a weekly POI, don't act until a 3-candle swing forms on the daily

33 If price is not clear on the weekly, look at the daily; if it is not clear on the daily, look at the 4H.

Technical (continued)

34 If there is no news, plan the trade on the bias of structure and liquidity

35 In ICT/SMC, you mostly aim to capture the fourth candle.

36 In BTC, sessions don't work — read structure and liquidity instead

37 In US30, NAS100/US100 and GER40 (any index), sessions don't work — structure, POI, liquidity and swing highs/lows work.

38 In currency pairs, sessions work.

39 Indices are played through liquidity. Liquidity is of two types: swing type, and block type (every kind of POI) → FVG and POI.

40 In a move from A to B, POIs that support the bias give strong moves; POIs opposite to the bias give weak moves.

41 After an all-time high, good selling always comes after three-candle swing and capture the 4th candle.

42 Capture the trade only from the right place

43 In BTC, don't look at 1m displacement — look at the 5m/15m.

44 The main thing is to know the direction.

45 Don't trade outside sessions — but you can use the POIs formed outside sessions to take trades during sessions.

46 After a three-candle swing forms, the 4th candle buys/sells from the last POI. If the third candle has already done (mitigated) the last POI, the 4th candle will go as soon as it opens.

Technical (continued)

47 Don't play one session for both sides — play it for one direction only.

48 If there is only a BB/MB, the MB/BB will work. But if there is another POI below it, wait for the last POI.

49 Watch the last POI of the whole rally — price will either react there or break it.

50 If your last POI is still untapped and you see an entry above it, don't get involved — wait for the last POI.

51 If the entry is right, price will give the entry from the last POI and then go.

52 If, after the last POI is tapped, an FVG also forms on the same TF as the zone, that confirms the last POI will work.

53 If there is no POI, you can plan the entry after liquidity is taken, once an FVG forms.

54 Also look at the overlapping part of FVGs.

55 When there are FVGs both above and below, and the two candles between them overlap, it is called a HIPPO.

56 Always trade during sessions.

57 Asian session: USDJPY and AUDUSD.

58 London session: EURUSD and GBPUSD.

59 XAUUSD: London and New York sessions.

Technical (continued)

60 A POI is used only once. But if the bias (target) is not done, it can be used again — still, treat it as one-time use.

61 Find the right POI.

62 Use the sessions indicator

63 When the POI is very big and a very big reversal is due, wait for a three-candle swing on the HTF. Don't enter there on the 1m or 5m, because it takes time to form a range there.

64 If you enter from a POI in the Asian session, keep the SL at the POI's low/high.

65 Also look for three-candle swings on the 4H for entries.

66 Exit at the safe TP. If price goes further after that, don't regret it.

67 In BTC, mark at least the 1H POIs and liquidity

68 If price tapped a POI's FVG but did not hit the target, then when it comes back to the OB, that OB can work.

69 But if the bias (target) is done, the OB will not work. Even if it does, there will only be a small retracement, and price will tap the OB/FVG below and leave.

70 If the move comes within the first hour of the Asian session, don't force a trade after that

71 Whenever you trade a reversal, look for a 3-candle swing on the daily TF. At an all-time high, also check whether the 4th candle shows any downside FVG.

72 Last-POI / last-liquidity trades work very well.

Technical (continued)

73 If there is no OB on the bigger HTF but there is one on the LTF, it doesn't mean anything.

74 The Asian-session move lasts about 1.5–2 hours.

75 POIs against the bias work only temporarily; POIs in the bias direction give the full, large, strong move.

76 Bias: monthly / weekly / daily / 4H. Temporary bias: 1H / 30m / 15m.

77 At an all-time high, think of nothing except the 3-candle swing

78 When there is no news, price depends on structure → OB, liquidity and POI. Most trades come in the Asian and London sessions.You can get a big move in the Asian session

79 The Asian session is a very good session for making money

80 If structure is not clear, wait — the path ahead will become clear.

81 The liquidity of a weak OB also gets taken.

82 In BTC, do structure mapping on the 1H/4H

83 Whenever price wants to go to ERL liquidity, it first comes back to do (mitigate) the last POI

84 Suppose there is a 1H buying OB but your bias is sell-side. If there is a 5m FVG, take confirmation first, because you are at an opposing 1H OB.

85 If the FVG has been tapped and the OB is still pending, and it is in the bias direction, price can tap the OB and move.

Technical (continued)

86 If the news data is known to the whole world and it creates a very big candle, a very big quantity has been added, so there is a good chance price continues in that direction.

87 If strong selling or buying is coming, take confirmation from a double FVG on the same TF to capture the retest.

88 If price suddenly or strongly breaks a POI with a healthy candle, a trend run mostly follows — on the TF of that candle.

89 If price is at a 30m zone but no POI is forming on the LTF (e.g. 5m or 3m), a candle can suddenly drop, take the liquidity, and then give the actual move. That is why you enter only after a POI forms on the LTF.

90 And if there is no POI at the 5m and 3m on the LTF, and price taps the 1m and doesn't come back, then in our favour there is no POI — that is why price suddenly drops (moves)

91 If a war is going on, a gap-up on gold over the weekend is possible.When a war or a threat to any country comes, gold goes up.

92 After price reaches a POI, if a 3-candle swing forms, then also take confirmation from an FVG — the 3rd candle of the 3-candle swing should close

93 If price wants to go to ERL liquidity or a POI, it goes only after taking the last POI liquidity.

94 Sometimes, when price comes to the 30m and you have doubts, wait for displacement along with ITL/ITH on the LTF, e.g. the 15m.

95 In crypto, POI, OB, FVG and liquidity are needed. In US30 / GER40 / US100 / NAS100 / Nifty / Bank Nifty, liquidity trades are taken

Technical (continued)

96 In gold and pairs, keep bias and sessions together, and plan the trade within that

97 When price takes external liquidity, it goes up to the last POI.

98 If you miss the entry, then when an FVG forms on the 5m at the 30m, enter after it forms, and keep the SL below/above the 30m. Don't wait for the retest

99 When the liquidity grab happens fast, price falls and comes back again, or reacts. But when the liquidity grab is slow, price reacts or gives a strong pullback at the next liquidity

100 When a 15m liquidity grab happens, the 5m and 1m should show only a wick there. If a body forms on any TF, the liquidity grab can be fake.

101 Suppose there are two 30m selling zones. If price breaks the first zone strongly — with a body close — it can go to the second zone.

102 First the daily TF does OB + FVG and the liquidity grab, and then the move comes

103 The market needs liquidity and pullbacks as fuel. But for the overall direction, the weekly decides Look at the weekly TF to see the overall narrative

104 Make a roadmap: ① Like the yearly bias. ② Reach the OB and FVG / liquidity; look for the pullback. ③ Reaction and strength analysis — e.g. POIs supporting the bias have much more strength than opposing ones. ④ Like your bias, find POIs that support it, then look at those POIs. ⑤ Once the HTF is complete, it predicts the candle for intraday

105 Daily candle pattern: ① The market opens and moves in one direction. ② Or a retracement / pullback. ③ Manipulation day — buy and sell liquidity. ④ Balance day — the whole day stays in a range. → Make a roadmap of its daily candle.

Technical (continued)

106 In the next day, price will first make the day's high or low, and the expansion will come in one of the sessions. • The market will take the previous day's (PD) high or PD low liquidity, • or the previous swing high or low, • or it will break the PD low or high. • Inside day or outside day. • Or it will fill the gap of the candle formed yesterday

107 When displacement happens, the market spends some time. After that, it moves again with displacement — or it taps an OB or FVG formed after the displacement, or an MB/BB, and then falls (moves) again.

108 If there is a 4H OB above, price can go up to it only if it forms a buying POI from below. But if it then forms a selling POI again, price will tap that selling POI and fall.

109 When the TP is done, wait for the pullback to come and see where the pullback comes from. After the pullback, price will continue.

110 TF order followed: monthly / weekly / daily / 4H → 1H → 15m → 30m → 5m → 1m. Displacement can be seen on the 5m.

111 If price is in a range, take the trade only after the last OB, the last liquidity or the PDL/PDH is hunted, and keep the TP small.

112 After price comes to the 30m, wait for the defence point to form, then for at least a 5m FVG

113 If we wait for OB + FVG, then after price comes to the opposite direction, if price makes big displacement, there will be a trap.

114 The daily/4H/1H pullback comes from POI or liquidity.

115 For the monthly target to be done, the pullback comes from the weekly. For the daily, the pullback comes on the 4H/1H.

Technical (continued)

116 And if price is at a weekly key level, it will go to the next weekly key level or liquidity.

117 Mostly look at the 3-candle swing and 4th candle on the daily TF

118 In displacement and expansion, you can trade from the FVG in the middle — 5m/15m — but the best confirmation is 1m/3m.

119 When price is near the daily/4H/1H liquidity, there are bigger chances it hunts that liquidity

120 Trade only in Asian/NY sessions. If there is news, then only NY

121 On the 3rd/4th candle or with high-impact news, price mostly does not come back to the 15m/5m OB + FVG; otherwise it will always come. Also, if a very healthy candle forms while the FVG is forming, there is a chance price won't retest.

122 If the HTF key level / POI / liquidity is done (e.g. a monthly/weekly/daily 3-candle swing), there is less chance of a retest of the FVG + OB on the 15m/5m.

123 Sometimes price doesn't respect the 15m/5m POI, so it always takes liquidity — it has a fractal nature. Until the key level is done, or price goes to the 30m/1H and then respects it, it means it is tapping the 30m/1H. (BAG → gap is also seen.)

124 If price is coming from an HTF (W, M, daily swing) and there is no POI on the 15m/5m, then look at the 30m/1H/4H and plan accordingly. Always use the fractal nature: LTF 5m → displacement

125 If price is at the daily low/high, or price is in a range, there is a very high chance it will take the high/low and then move.

126 After the HTF's key level, with multiple trades you can trade on 5m/15m OB + FVG, with confirmation.

Technical (continued)

127 In displacement/expansion, price mostly doesn't retest the 15m/5m POI of the candle. But do strength analysis of POIs — e.g. how the POI formed

128 Combine 3 TFs: daily → 4H/1H → 15m; 4H/1H → 15m; FCZ → if it is the TF in the nip model, then called FCZ → spike point. Will come. If the 3 TF combination is mismatch is there in POI then that zone not strong zone

129 When there is no OB on the daily TF, mark liquidity — do the same for all TFs. When there is no OB, mark liquidity.

130 If there is a meeting, trade after the meeting. And after news, especially NFP news, there is a very powerful full move.

131 Last-POI / liquidity trades work very well with the bias.

132 If you are waiting for a retest, there should be a POI on the opposite side; then the retest will come

133 A weak OB / fake OB's liquidity mostly gets taken, especially on the 4H/1H.

134 Mostly, the price reversal/pullback happens after a 15m POI forms.

135 A weak OB / fake OB's liquidity mostly gets taken, especially on the 4H/1H.

136 At the ATH, you need a 3-candle swing; if there is an FVG, you also need the 4th candle. Plan for the reversal.

137 If all M/W/D POIs are done, look at the 4H/1H/30m structure. When there is no POI, look at liquidity.

138 If the OB's length is small, then refine to the last POI (daily OB).

Technical (continued)

139 Every TF has a main TF above it: daily → weekly; 4H → daily.

140 If price want to go up and there is no POI then if new POI form for upside then that is the an A+ setup.

141 When price takes out the swing lows/highs and does stop hunting, price moves at very high speed.

142 When price is at the ATH, don't look at old data — look at the previous candle. If price is in a range, look at the last 3–4 days of data. If there is no POI, wait for a POI to form.

143 In some cases, price doesn't have a big wick, so it means the PD candle did the magnet point. Now this candle's job is only to run.

144 If the HTF (W/M/D) bias is up and there is no POI on the daily, then see on the 4H/1H liquidity or POI or PDL/PDH

145 When price is at the ATH, you can skip the Asian session — you will know the price. FLOD price will come, or LLOD

146 If the Asian session doesn't respect the FLOD, then London/NY will reach the LLOD (OB) price.

147 A pullback always comes before the target — that is best.

148 VI can be used multiple times. On Monday, skip the Asian/London sessions.

149 If price is coming down before the pullback target is done, then otherwise it's coming down after the TP — it means a reversal.

Technical (continued)

150 In expansion, the first pullback comes below the first displacement, and a second pullback comes after the displacement — then it taps the last POI and rallies again.

151 There are two expansions. When price is at a daily-TF POI, the first pullback comes, and a second pullback comes after the last POI. Mostly, the second expansion comes only after the first expansion's pullback.

152 When news happens, if 1H/30m first taps the 30m and then the 1H/4H, then 30m → find the last POI.

153 If a 4th candle opens and goes beyond the 15m/30m POI, it is news; then after the 1H/4H it rises.

154 Every time in gold, after a bull run, price goes into a range. In the range, PDH/PDL will need to be marked, or the previous swing's POI will need to be marked

155 At the ATH, FLOD – FLOD stays. And if there is upside news, it taps the MB and stays at the ATH.

156 A swing-type OB is strong — it works like a lock.

157 The ITL stays safe until price does its last POI, and the ITH stays safe until price does the last POI below it.

158 Two types of Liquidity → swing type; OB-type

159 If on the 4H all candles are inside candles, then refine on the 1H or 30m/15m — then the picture becomes clear (it is a range).

160 When the FVG is also very big, selling comes, and price completes the FVG 50% or 75% and falls again (vice versa).

Technical (continued)

161 If there is no continuation, a reversal or pullback will come — price will go to the last POI.

162 VI(Volume Imbalance) and ranges don't close below/above until the body closes. VI is valid until then. VI can be used multiple times.

163 Wick-to-wick VI is best. There is a 70–80% chance the VI gets filled. This VI is called an MP (magnet point), because it pulls price like a VWAP.

164 The daily swing liquidity and the PDL/PDH liquidity are different. When price takes the swing's liquidity, it moves at very high speed. The swing's liquidity works like a swing.

165 If the bias is against the liquidity, the liquidity if that Liquidity hunted then. it supports the bias,

166 If there is no POI below the liquidity, then the liquidity is safe, and blocks work. Up to the 1H, mark ERL/IRL.

167 If its bigger TF has no OB, then finding an OB on a smaller TF means nothing

168 When the 30m closes its body, the 30m fails. And if a wick forms, it is a liquidity grab

169 The value of an FVG is when there is an OB with it. Until price is at the ATH, don't run with it.

170 Let's say there is no swing on the 4H. Then the market takes the SL of the 1H/30m/15m swings. If structure is not clear, wait for structure to form.

171 If there are two POIs on the downside and you are confused whether price will go from the first or the second POI, wait and watch whether a POI forms that will take price to the second POI.

Technical (continued)

172 The bias of a POI means nothing — the bias is just the SL from liquidity.

173 The ITH/ITL doesn't break until the bias changes, but STL/STH can break — they mostly break while the temporary bias/liquidity is not done. If the bias is wrong, the ITL/ITH will break.

174 If price is at an all-time high and an ITH has formed, then the STL and ITL will break.

175 If the STL breaks, something is wrong. Find the POI or liquidity/SL, e.g. find the internal bias

176 When price is in a range and neither the ITH, the STL nor the STH is breaking, wait — price is still in the range.

177 On the 4H or 1H, STL/STH, and 15m ITH/ITL: their meaning is different. ITH/ITL are strong, and normal 15m ITL/ITH are temporary. For 15m → MSS → see on the 1H/4H.

178 The overall bias depends on the 4H/daily/1H — the bias always moves towards ERL

179 Structures that form against the bias create IDM (inducement) inside them. That creates liquidity and traps retail traders, and then the move comes from the right place.

180 If we find the wrong bias, confirm it from P/D (premium/discount), the ITL/ITH and the MSS.

181 The bias's job is to hunt liquidity and SL. The bias is not on one TF only, and liquidity is not on one TF only. If there is no liquidity, the POI will break — that POI is fake.

Technical (continued)

182 When price goes to the LTF, after the HTF, a new POI starts forming. And if it doesn't tap all the POIs on the LTF, then the POI on the HTF will not form.

183 The HTF decides direction; the LTF builds liquidity. The mid TF does pullback/continuation, and the people inside it build liquidity — that is what gets hunted.

184 The more liquidity is collected, the bigger the move. The more time is spent on the POI, the more displacement it will cover.

185 Whenever HTF liquidity is swept, or an HTF candle comes down strongly, you can plan the trade below the wick. Keep the SL there, and always keep TP at internal POI or liquidity.

186 An already-tapped OB is a low-probability OB

187 Always, after the main POI is tapped, the pullback comes after the displacement.

188 Whenever displacement comes from the daily TF, a pullback from there is necessary; only after that does the continuation move come. The pullback comes back into the displacement it came from — from the bottom to the top — up to the last POI.

189 When there is no defence point in the market, the market itself creates a defence point — then it is a high-probability setup.

190 IRL is always on the 15m/ 5m. TF

191 If the KL has not been taken and price is ranging, it will take the KL through manipulation and then expand. Avoid the manipulation after the range.

192 If price takes the KL and stays in a range, then direct expansion will happen. Avoid the range and the manipulation after it

Technical (continued)

193 Price respects POIs on the monthly TF, on the weekly TF, and on the daily TF. But first the daily, then weekly, then monthly — but it respects all POIs according to the HTF POI.

194 In any POI, wait for a 3-candle swing to form.

195 When a POI is done on one TF, price forms a POI on another TF.

196 First the month's last POI, then the week's last POI, then the daily's last POI, then in the 4H/1H the last POI

197 Use Premium and discount tool

198 Almost every big momentum gives a CISD. You need to see the CISD — in a CISD, an external liquidity grab is needed

199 When the market wants to break the ATH, it first does (mitigates) the last POI on the 1H.

200 On a POI, a 3-candle swing forms — temporary bias and liquidity. Also understand temporary and main POIs.

201 In BTC, do structure mapping on the 4H and 1H. The actual bias can be found on the HTF. BTC → only liquidity works.

202 When price is at the ATH, wait for a 3-candle swing. A reversal comes only after it. There is no other option — plan the trade for the daily 3-candle swing.

203 When there is no POI on the upside, price takes liquidity and then goes up. 4H/1H/daily/weekly/monthly.

Technical (continued)

204 Do advanced structure mapping on the 4H/1H, or at most the 4H. If you are trading last-POI trades, they work very well.

205 When a POI is very big and a big reversal is coming, wait for a 3-candle swing on the HTF

206 If there are POIs on both sides, give priority to the overall bias, e.g. LRL trades. Always trade only inside sessions. When there is no POI, price takes external liquidity.

207 If there is a 15m buy and 15m sell, and the overall bias is down, then the move will tap the buy POI, the buying POI will not form, and the buy POI's job is done — the selling job continues, with the bias.

208 If data mismatches, e.g. there is a 4H POI but no POI on the 1H, the 4H POI is weak and very low probability. Similarly, a 1H POI with no 15m POI is a hollow POI — about a 90% chance it fails. You can use such WOBs for marking liquidity.

209 If displacement is short, then the pullback will come within the length.

210 There is a weekly POI below and the daily POI is about to break — but not suddenly. How? While the daily was running, a POI was forming on the weekly and the trap was already set. Now it is the weekly's turn to be tapped.

211 Whenever price runs, it means a POI is forming on its HTF. Then that POI's turn to be tapped comes, then the TF above it, and so on.

212 Every TF comes with its turn of tapping, and every TF's turn comes when it breaks.

213 Market fractal nature: depending on the POI. E.g. first 5m → 15m → 30m → 1H → 4H — wherever the 1H is done, because if the daily POI is done, the 1H POI will also break.

Technical (continued)

214 When LTF POIs get done, POIs are created on the HTF too. E.g. if price is going up on the 1H, a POI is being created on the daily — the 1H move is just a show; the daily is creating the POI.

215 If one TF is being skipped, it means something is building on its HTF.

216 Continuation always comes first; the pullback always comes before it. During the pullback, where the pullback ends is where the continuation starts.

217 After continuation, a pullback or reversal comes, depending on whether the bias is up or down

218 Liquidity pools: • EQH/EQL → PDH/PDL
• Trendline → PWL/PWH
• Range → support/resistance
• Swing high/low

219 HTF bias + FLOD + LLOD + structure mapping: ITH/ITL / STL / STH.

220 AMD works on the HTF and on the PD array or bias. AMD can play inside sessions. Every day / week / session will start with a Judas swing.

221 A fake move comes first, before the real move — that is the Judas swing. On the 4H / daily / weekly / monthly / session, the Judas swing comes at the start.

222 If a Judas swing doesn't form in a particular session, it has already formed in the session before it.

223 When price buys/sells at PDL/PDH, or buys/sells at PWL/PWH, those turtle-soup traders do buy/sell after liquidity

224 If the daily candle is very big, then liquidity gets taken on both sides of PD then next day stays very sideways, it won't take the high or the low.

Technical (continued)

225 If a big candle opens near the high/low of the next day's candle, it takes liquidity. If it forms a doji, the next candle will stay sideways. If the next candle opens in the middle, it will also stay sideways in the middle. If price opens in the middle, don't trade.

226 If price action is bullish, from the opening of the monthly candle, buy from below and sell from the high (vice versa). Same for weekly.

227 If there is an OB + FVG or POI somewhere but it is very far away and it makes no sense for price to go there, swing liquidity becomes very important — price grabs one swing's liquidity and goes to the next swing.

228 For swing bias, the weekly profile is good, but also check the daily bias so you don't get caught in a temporary move — i.e. don't fall into the temporary bias's trap.

229 When a PD array doesn't work and the body closes, then remove that PD array.

230 If there is FVG + OB, it also does liquidity. This is called internal range liquidity

231 FVG overlapping is additional confirmation — AOB, MB, BB.

232 When a POI's very big candle forms, it hunts the last candle of that POI (the big candle); after that, expansion comes.

233 After a POI is tapped, continuation will happen when the 3-candle swing doesn't break.

234 Friday: if price falls, then at that time some traders — they try to chase prices. Because the market closes, they want to trade and continue; then if it falls/goes up, the market punishes.

Technical (continued)

235 With the overall bias, a temporary move comes in the opposite direction — and liquidity and order fill happen for that.

236 MB is part of the overall structure.

237 If there is no FVG + OB, then AOB is used. If the overall continues there, and below/above there is no reason, then AOB is used.

238 If the bias is up, there will be a little struggle on the upside, but overall price will go up.

239 OB → price makes a range → liquidity grab is a must for OB → FVG → liquidity grab. (True OB)

240 A block can be located not only at highs/lows, but also in the middle of the move.

241 The IFC candle serves as a strong reversal indicator → it must grab liquidity.

242 When price is near the daily high/low, the next day's candle grabs the low/high liquidity, then makes the move.

243 If MB and FVG are overlapping, then it becomes high probability.

244 If in the entire area there is no OB and FVG, then OF/AOB will work. If OF are tapped then they don't work; OF unmapped will work.

245 If price is in an uptrend, then it will grab PD liquidity, then it will go to the downside till the POI of the downside, and will go upside again.

246 But if price is in a downtrend, then after it grabs the PD high liquidity, it will go down till the last POI

Technical (continued)

247 If the trend is up, then if the PDL liquidity gets grabbed, it will stay up to the PDH target

248 If the trend is down and the PD low liquidity is grabbed, then from the POI it goes up and then comes down again.

249 If liquidity is collected, then only OB, FVG and OF will work with high probability

250 External liquidity:
- Swing low/high
- PDH/PDL / PWH/PWL / PMH/PML
- OB + FVG type liquidity
- EQHs / EQLs

251 We have a bias/POI on different TFs, and all of them get done according to their own TF. HTF POIs are much more important than LTF POIs.

252 If no POI forms for a long time and price is making a range, the tighter the range price is stuck in, the better the move will be.

253 If we are in buying, then we need an OB defence point. And in buying, if there is a selling OB, the selling dominance will go

254 If both buying and selling have an OB + FVG, the one that gets tapped first becomes useless.

255 When price hunts the swing's liquidity, then up/down, if there is no POI, and if the new POI forms after the swing liquidity hunt, in 15m/30m/1H the direction becomes clear.

256 If price made OB + FVG on the 15m, after that it does the last 15m POI. If there is no defence point, then on the 15m, the 15m liquidity gets taken up/down. Take confirmation on the 5m. If on the TF above, like 30m/1H, there is a POI, then it looks there. And sometimes, 15m OB liquidity also gets taken

Technical (continued)

257 If a candle joint is forming, it is traps. If there is a trap, there is no displacement. But if there is a healthy candle and an FVG forms, it is real displacement

258 The HTF and LTF views should be the same and in the same place, e.g. HTF → LTF and daily (4H/1H)/15m → OB + FVG in the same place.

259 Every TF works first; after that it traps. E.g. after the 4H OB is done, it traps. After the 4H is done, it traps on the LTF too.

260 For reversal we need a 3-candle swing. But if at the ATH there is a daily FVG and news is +ve, consider the 4th candle on the 3-candle swing. Plan reversal, not the 4th candle. Signal reversal is 4th-candle plan

261 POIs on the HTF work 70% with bias and fractal + news. Like daily, according to the TF, moves will come according to daily, and according to monthly — the monthly move will come.

262 In a range, look at structure. The FLOD that has seen the ATH's candle. PDL/PDH works very well.

263 If the swing's liquidity (daily swing liquidity) is at the ATH, there will be a small reaction — but in the bias's opposite

264 If the 3rd candle has done the POI, the 4th candle won't come. If the 3rd candle hasn't done it, the 4th candle will do the last liquidity or last POI and run.

265 If the second candle is not a selling candle and the third candle is not an inside candle, the 4th candle's major role will be to go up from the last POI.

266 Where news has already tapped the 30m or 1H first, enter there immediately with the SL at that 30m/1H/4H zone. The SL will be big — that's fine, the TP will be big too. This is the 4th-candle expansion.

Technical (continued)

267 And where your 15m POI retest does not happen, a big rally comes there, and 1:5 … 1:8 RR is achieved

268 If there is no POI, mark the daily high/low and enter on 4H/1H → 15m, with 5m → 1m confirmation.

269 At the ATH, look at the previous candle and take the decision. For other cases → do an overall analysis.

270 The candle behind the OB also matters. E.g. if a selling candle takes the liquidity and a buying candle forms the OB, that OB is powerful — even if the OB colour is green.

271 When there is no POI, and price goes upside/downside, it takes liquidity and moves. Like HTF 4H/1H/daily.

272 If you are doing advance structure mapping, do it on the 4H/1H. In BTC, only use max 4H; below the 1H it doesn't work.

273 In BTC, take the bias from the overall liquidity. If there is no news, the market moves on structure and liquidity. If there is no POI, mark liquidity.

274 On Monday, there is mostly no news, so plan according to structure and liquidity

275 If there is no news, mostly the Asian and London sessions give the move. If the Asian move has come, then London; and if London hasn't moved, then NY will move

276 For displacement, look at the FVG — and the displacement should be strong.

277 Consolidation high and low should be marked. After consolidation, the liquidity grab happens, then a new POI forms — the bias direction.

Technical (continued)

278 When not to trade
① Before FOMC
② Before CPI
③ Before NFP release
④ Before the Fed Chair speaks
⑤ Before tentative report/data
⑥ Red-folder news

279 Everything OHLC/OLHC: buy below the opening price, where the bullish (vice versa). All concepts are subordinate to the OHLC/OLHC (BRK, OB … etc.). Every PTS that ever happened below the opening price (vice versa).

280 Stages of an ideal trade: ① Planning (marking KL) ② Waiting (for KL to hit) ③ Execution ④ Waiting (for TP)

281 Avoid trading → range, retracement and manipulation. Trade only displacement → pullback → expansion → reversal

282 Candle phases:
• Open → Range → generating liquidity
• High → Manipulation → purging liquidity
• Low → Expansion → neutralising liquidity
• Close → Range → reset

283 DOL:
① Range high and low
② Candle range high/low
③ HTF KL
④ P/D of a dealing range
⑤ Equilibrium of a dealing range or expansion swing

284 If there are OBs on both sides, give priority to the overall direction and wait. After that, do a strength analysis on the LTF.

285 Before anything happens on the HTF, the LTF supports it first.

Technical (continued)

286 A 5m rally moves according to the 5m timeframe — the same is true for every TF.

287 An OB usually works only once. But if there is no other OB in the opposite or current direction, it can work a second or third time too.

288 Price goes to collect fuel so that it can continue its move

289 Price collects fuel through pullbacks

290 Know the overall view. If a candle forms against it, take advantage of that.

291 If price has to fall from a level where there is no POI, it will create a POI there itself and then fall.

292 Whenever you trade, you should know the overall bias and information.

293 When a trade is running, predict how far it will go — to the last POI or the first POI. Current price action will tell you this.

294 If price keeps forming OBs in the same direction, it will continue in that direction; otherwise a reversal will come. Current price action will tell you which

295 Mark OHLC / OLHC (candle open-high-low-close profile).

296 Pullback → Displacement → Expansion → Retracement → Reversal. Reversal happens from a 4H / 1H POI or liquidity ($$).

297 HIPPO → the overlapping part of two FVGs.

298 WOB | FOB (fake or liquidity order block types) and strong order block type.

Technical (continued)

299 Check news: high-impact and tentative reports / data.

300 Entry TF 5m / 15m: best entry is OB + FVG with displacement and a healthy candle.

301 Market structure on 4H / 1H → ITL / ITH.

302 Displacement + FVG reading (strong move).

303 Mark the fractal compression zone.

304 MSS → used for bias reading.

305 A pullback will not move smoothly.

306 CISD + liquidity ($$) — IRL, external / internal.

307 Check this on the HTF too: CRT + KL + AMD / PO3 → Judas swing.

308 Range market: liquidity grab / sweep (last POI).

309 PDL | PDH | PWL | PWH → use only in a ranging market, together with bias + POI.

310 Liquidity (SL) → IRL / ERL → Target.

311 Displacement | Expansion | High-impact news | Reversal | 4th candle | 3rd candle | M / W / D | KL | liquidity ($$) → less chance of a retest of the 5m / 15m POI.

312 Fractal: 1m → 3m → 5m → 15m → 30m → 1H → 4H → Daily → Weekly → Monthly
Structure → POI → Liquidity → TF

Technical (continued)

313 Avoid trading: ranges | retracement | manipulation | before FOMC / CPI / NFP / Powell speech / red-folder news | immediately after the open of the market, session, day, week or month.

314 Narrative → Why? · Where? · When? HTF → Monthly / Weekly / Daily / 4H / 1H.

315 Weekly pullback mostly comes from a daily / 4H key level.

316 Reversal + expansion candle = high probability.

317 Analyse both possibilities (bullish and bearish scenarios).

318 For a reversal, wait for a 3-candle swing.

319 During confirmation, look for a rejection candle and a healthy candle:
- 15m POI → confirm on 5m / 3m
- 5m POI → confirm on 1m / 3m
- 3m POI → confirm on 1m
- 1m → red / green candle

320 Mark FVGs of Monthly / Weekly / Daily / 4H / 1H.

321 Liquidity grab / sweep · Liquidity voids | LRL | HRL (low / high resistance liquidity).

322 IRDRE (fair value area) → zone.

323 4th expansion candle | 3-candle expansion.

324 EQHs | EQLs | trendline | support | resistance = liquidity.

325 No OB + FVG → target liquidity: daily, daily swing, or 4H / 1H swing.

Technical (continued)

326 Target the ERL of 4H / 1H / 30m / 15m / 5m.

327 No compromise with TP and SL.

328 After a very big rally, when price reaches a key level, don't plan a reversal immediately — wait for the ITL / ITH to form, along with an FVG.

329 If the 30m zone is going to break, there will be no MSS, the opposite side's swing won't break, and no FVG will form.

330 When price has done all the POIs and liquidity below, it runs at very high speed.

331 Don't trade an OB that is already more than half filled. If you still want to trade it, analyse it on the HTF first, then trade.

332 If the target is still pending and a pullback has come after the displacement, a simple continuation will come — up to the target.

333 If the 3rd candle is inside the 2nd candle (inside bar), mostly take 1m confirmation.

HTF Roadmap & Daily Candle Plan (checklist)

DAILY PREP · BEFORE YOU TRADE

Read the HTF → Plan the Day

1 Weekly → 2 Roadmap → 3 Candle type → 4 Next day

STEP 1
Overall direction (Weekly)

- [ ] **Check the weekly TF** — what is the overall narrative?

> **Remember:** the market needs $$ and pullbacks as fuel — but the weekly decides the overall direction.

STEP 2
HTF roadmap

- [ ] **Bias** — set the big-picture bias (yearly / monthly / weekly).
- [ ] **Reach** — mark the OB, FVG and $$ where the pullback can come.
- [ ] **Reaction & strength** — check how price reacts there. POIs that support the bias are much stronger than opposite ones.
- [ ] Find the POIs that support the bias.
- [ ] Watch from that POI for the move.
- [ ] HTF complete → predict today's intraday candle.

STEP 3
Today's daily candle type

CHOOSE ONE

- [ ] **Trend day** — Opens and moves in one direction.
- [ ] **Pullback day** — Retracement / pullback day.
- [ ] **Manipulation day** — Takes both buy-side and sell-side $$.
- [ ] **Balance day** — The whole day stays in a range.

STEP 4
What will the next day do?

CHOOSE THE LIKELY ONE

> **Expect:** the day's high or low forms first, and the expansion comes in one session.

- [ ] Takes the PD high or PD low $$.
- [ ] Takes the previous swing high or low.
- [ ] Breaks the PD high or PD low.
- [ ] Inside day or outside day.
- [ ] Fills yesterday's candle.

PART 6 · PSYCHOLOGY

Trading Psychology

Psychology

1. Following risk management is enough — follow it, and don't trade on the LTF.
2. In trading, keep control over yourself.
3. The main thing in trading is discipline.
4. Profit comes only from holding the right trade.
5. I don't look at the market — I look at the system.
6. You can't capture every entry and every move.
7. If you set the TP with logic, you won't have to regret it.
8. Don't decide in advance to take 1:5 RR — accept what the market is giving. Set the TP as a safe TP according to the structure.
9. If you are in a trade, focus on it completely — don't take another trade.
10. Make two accounts: one for swing trading and the other for intraday trading.
11. The fear of the profit running away
12. The whole problem in trading is mindset: fear of losing profit, and fear of the trade running away while you wait for the entry. Accept these and maintain risk management.

Psychology (continued)

13. Intraday trades: at least 2–3 trades a week are fine
14. Every night, predict the next day's candle
15. you should not judge whether a trade was good or bad only by looking at whether it hit Take Profit (TP) or Stop Loss (SL).
16. You should judge the trade based on whether you followed your trading strategy correctly
17. A missed trade is better than a losing trade.
18. After news, take the trade with the bias and confirmation.
19. If price is reaching 1:2 RR, don't force it. Book according to the TP.
20. In trading: wait (90%) → patience; trade only 10%
21. Execution → win journal: repeat. Loss journal: avoid. Miss journal: catch next time
22. Don't change your decision again and again — even if it means only 4 trades in a month.
23. Do rule-based trading.
24. Trade like a robot, exit the trade safely, and don't get too greedy.
25. Don't decide in advance to be a buyer or a seller. You are a trader: trade wherever you find an opportunity.
26. Don't be biased towards one direction in advance.

Psychology (continued)

27 No regret for missed trades.

28 Be the hunter, not the hunted.

29 The market punishes emotions.

30 **Small mistakes create big losses — be disciplined!** ★ KEY RULE

31 **Follow the plan → protect your capital.** ★ KEY RULE

★ GOLDEN POINTS · ALWAYS REMEMBER

No. 30

Small mistakes create big losses. Be disciplined!

No. 31

Follow the plan → protect your capital.
